

### ### Evaluation Task: Fetching and Displaying Articles from [Time.com](https://time.com) API

#### #### Task Overview

You will build a React.js application using Vite.js and Tailwind CSS that fetches articles from the [Time.com](https://time.com) API. The task evaluates your ability to interact with external APIs, manage state, and create a responsive user interface.

#### #### Requirements

##### 1. **\*\*Fetch Articles\*\*:**

- Create a component that fetches the latest articles from the [Time.com](https://time.com) API.
- Display the article titles and publication dates in a list format.

##### 2. **\*\*Article Details\*\*:**

- Allow users to click on an article title to view more details, such as the author and a brief summary.
- Display the selected article's details below the list.

##### 3. **\*\*Search Functionality\*\*:**

- Implement a search bar that filters the articles based on the title.
- The search should be case-insensitive and update the displayed list in real-time.

##### 4. **\*\*Responsive Design\*\*:**

- Ensure the layout is responsive and looks good on both mobile and desktop screens.
- Use Tailwind CSS for styling, focusing on utility classes for responsiveness.

##### 5. **\*\*Loading and Error States\*\*:**

- Display a loading indicator while fetching data.
- Handle errors gracefully with an appropriate message if the API request fails.

## 6. **\*\*Good UX Practices\*\***:

- Provide feedback on interactions, such as highlighting the selected article and changing hover colors on buttons and links.
- Ensure smooth transitions and a clean, modern look using Tailwind CSS.

## #### Evaluation Criteria

- **\*\*API Integration\*\***: How well you fetch and handle data from an external API.
- **\*\*State Management\*\***: Effective use of React state to manage fetched data and UI interactions.
- **\*\*UI/UX Design\*\***: Adherence to responsive design principles and good UX practices.
- **\*\*Code Quality\*\***: Clean, well-organized, and maintainable code.
- **\*\*Error Handling\*\***: How gracefully the application handles errors and edge cases.

This task will assess your ability to create a functional, user-friendly interface that interacts with real-world data sources while adhering to best practices in front-end development.
